

Aurastack Omnichannel Intake – Inbox & Customer Portal Documentation

Overview

The Inbox and Customer Portal form the "Omnichannel Intake" layer of the Aurastack platform. They are seamlessly linked to ensure that every customer request—whether via chat or email—is captured, classified by AI, and routed to the correct automation workflow.

1. The Link: Customer Portal & Inbox

Relationship

The relationship between these two interfaces is a Real-Time Synchronized Thread:

- **Customer Portal (The Front-End)**
This is the interface used by policyholders. When a customer starts a "New Request" (e.g., a Claim or a Quote), they are creating a Conversation object.
 - **Inbox (The Back-End)**
This is the interface used by internal agents. Every request submitted in the Portal appears instantly in the Inbox.
 - **Shared State**
Both views share the same message history, attachments, and status (Open, In Progress, Converted to Case). When an agent replies in the Inbox, the customer sees it in the Portal, and vice versa.
-

2. The Customer Portal (Policyholder View)

Purpose

Designed for simplicity and trust, the Portal allows customers to manage their relationship with the insurer.

Left Sidebar

- **New Request CTA**
A primary button to initiate a new interaction.
 - **My Policies Card**
Displays active and expired policies (e.g., "Health - Gold Plan") for quick reference.
 - **My Conversations**
A list of recent support threads with status indicators (e.g., OPEN or RESOLVED).
-

Center Panel (The Interaction Zone)

- **Request Type Selector**
A grid of options like "Get a Quote," "File a Claim," or "Update Nominee."
 - **Intake Form**
A dynamic form that adjusts based on the request type (e.g., asking for "Annual Salary" for a Sales Application).
 - **Chat Interface**
A clean, modern messaging area where customers can talk to agents and upload documents.
 - **Conversion Status**
A green confirmation card that appears once a request has been successfully moved into the "Active Fleet" (Cases).
-

3. The Inbox (Agent Command Center)

Purpose

The Inbox is a high-density workspace where agents manage incoming traffic with AI assistance.

Left Panel (Thread List)

- **Global Filters**
Toggle between ALL, OPEN, and RESOLVED threads.
- **Aura Intake AI Status**
A live indicator showing that the AI is actively classifying intents and extracting data from the background.

- **Search Bar**
High-speed search for messages, subjects, or customer names.
 - **Thread Cards**
Each card shows the channel (Email/Chat), request type, subject, and a snippet of the last message.
-

Center Panel (The Thread)

- **Header CTAs**
 - **Resolve & Trigger Workflow:** The most critical button. It manually converts the conversation into a formal Case and triggers the appropriate workflow (e.g., claims_mgmt_v1).
 - **View Case:** Appears once a thread is linked, providing a direct link to the Case Detail view.
 - **Simulate Response:** A developer tool to test how the system handles incoming hospital or vendor replies.
 - **Message Thread**
A chronological view of the conversation, including AI-generated summaries and attachments.
 - **AI Suggested Reply**
A "Magic" box that generates a draft response based on the conversation context, which the agent can use or edit with one click.
-

Right Panel (Contextual Intelligence)

- **Customer Profile**
Displays the policyholder's history, location, and contact details.
 - **AI Extraction Insights**
A real-time view of what the AI has "read" from the conversation, including:
 - **Confidence Score**
How sure the AI is about its extraction.
 - **Extracted Entities**
Policy numbers, estimated claim amounts, and incident dates.
 - **Exchanged Documents**
A dedicated list of all files uploaded by the customer, with quick-view links.
 - **AI Quick Actions**
Context-sensitive buttons like "Initiate Identity Check" or "Run Renewal Risk Model" that trigger specific AI sub-routines.
-

4. Intake Management & Routing Logic

Workflow

Aurastack uses a "Dispatcher" pattern to manage intake through the Omnichannel Intake & Routing (omnichannel_routing_v1) workflow.

Processing Steps

- **Classification**
As soon as a message arrives, the Aura Intake AI analyzes the text.
- **Intent Mapping**
The AI maps the request to a specific IntakeType:
 - CLAIM → Routes to Claims Management
 - QUOTE → Routes to Policy Issuance
 - HOSPITAL_INTAKE → Routes to Hospital Exchange
 - KYC → Routes to Patient Onboarding
- **Entity Extraction**
The AI pre-fills the case metadata (e.g., extracting the claimant's name and policy ID) so the agent doesn't have to type it manually.
- **Conversion**
When the agent clicks "Resolve & Trigger," the system:
 - Creates a new Case.
 - Links the conversation history to that Case.
 - Starts the target workflow at the start node, passing all extracted metadata into the execution context.
